

CSS Basics & Background Styling

Scenario:

You are working as a junior frontend developer.

Your first task is to create a simple **company banner page** using HTML and CSS.

Your manager wants you to understand different ways of applying CSS and how to control the background of a webpage.

You need to create a simple webpage that displays a company logo, title, and description with different CSS properties.

Steps to Build the Project

Step 1: Create Project Structure

Create a new folder:

css-assignment-1

Inside the folder create:

```
css-assignment-1
├── index.html
├── style.css
├── images
│   └── logo.png
```

Step 2: Learn CSS Implementation Methods

In this assignment, you must use all three CSS methods.

Part 1: Inline CSS

Inline CSS is written directly inside HTML elements.

Example:

```
<h1 style="color:red;">
  Welcome To Our Website
</h1>
```

Task:

Apply inline CSS on:

- Main heading
- One paragraph

Part 2: Internal CSS

Internal CSS is written inside the HTML file using the `<style>` tag.

Example:

```
<head>

<style>

p {
  color: blue;
}

</style>

</head>
```

Task:

Create internal CSS for:

- Paragraph styling

- Background color
-

Part 3: External CSS

External CSS is written in a separate file.

File:

style.css

Connect it:

```
<link rel="stylesheet" href="style.css">
```

All main background styling should be done using external CSS.

Step 3: Create HTML Content

Create the following structure:

Company Name

Welcome To Our Website

We provide software solutions for businesses.

Our mission is to create simple and useful applications.

Step 4: Apply Background Styling

In style.css, apply the following properties.

1. Background Color

Add background color.

Example:

```
body {  
  
background-color: rgba(135, 47, 47, 0.1);  
  
}
```

Practice changing:

- Color values
- Transparency

2. Width and Height

Set page size.

Example:

```
.container {  
  
width:2000px;  
  
height:1500px;  
  
}
```

3. Text Color

Change text color.

Example:

```
h1 {  
  
color: rgb(47,10,10);  
  
}
```

4. Opacity

Control transparency.

Example:

```
.container {  
  
opacity:0.8;  
  
}
```

Try different values:

```
0.1  
0.5  
0.8  
1
```

Step 5: Add Background Image

Add company logo as background.

Example:

```
.container {  
  
background-image:url("../images/logo.png");  
  
}
```

Step 6: Control Background Repeat

Practice:

```
background-repeat:no-repeat;
```

Understand:

- repeat
- repeat-x

- repeat-y
 - no-repeat
-

Step 7: Background Attachment

Apply:

```
background-attachment:fixed;
```

Learn difference between:

```
fixed  
scroll
```

Step 8: Background Size

Practice these values:

Cover

```
background-size:cover;
```

Contain

```
background-size:contain;
```

Auto

```
background-size:auto;
```

Understand the difference.

Step 9: Background Position

Move the image position.

Practice:

background-position:center center;

Try:

background-position:top left;

background-position:top right;

background-position:bottom right;

background-position:bottom left;

background-position:40% 10%;

Step 10: Background Shorthand Property

Combine all background properties.

Example:

```
.container{  
  
background:  
red  
no-repeat  
fixed  
40% 10%  
url("../images/logo.png");  
  
}
```

Understand the order:

```
background-color  
background-repeat  
background-attachment  
background-position  
background-image
```

Student Instructions

1. Create folder structure.
2. Create HTML page.

3. First practice Inline CSS.
 4. Then practice Internal CSS.
 5. Finally create External CSS file.
 6. Apply background properties one by one.
 7. Change values and observe browser output.
 8. Submit:
 -
 - Live demo link
-

Submission Instructions (GitHub)

1. Create a **public GitHub repository**
Repository name format:
YourName_CSS_Assignment-Basic
2. Upload project files.
3. Deploy project using:
 - Github pages
4. Submit on LMS:
 - GitHub Repository Link
 - Live Website Link

What You Will Learn

- After completing this assignment, students will understand:
- What CSS is
- Different ways to write CSS
- How HTML connects with CSS
- How background works in CSS
- How to add images using CSS
- How to control image position and size

- Basic CSS properties used in real projects
